You may over-type the 'B' and 'A' factors if appropriate, but it is not necessary.

TOT variables: 7,386 = B 7,597 = A

(Lower values of 'B' favor slower boats; the 'A' value doesn't affect the results, but should be set to bring the TCFs to about 1.000).

1.0000 = TCF theoretical fleet

As calculated here, B is based on the fleet's average values for rhum line speed and phrf rating; A is simply a function of B.

0.474 = Average Fleet Speed

Time Correction Factor = TCF = A / (B + PHRF)

B = (3600 / AvgSpd) - AvgPHRF

A = B + AvgPHRF

210.7 = Average Fleet PHRF
